555	New nucleic acid enryme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and
F	for determining the concentration of a particular ion in a solution.

```
ö
                                                enzyme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photoderector. The biosemsors are useful for the sensitive and snelective detection of ions. The biosemsors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosemsors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a ribosyme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and
                                   present invention relates to biosensors, comprising a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /*tag= a

The present invention relates to biosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photodeteror. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a substrate of a ribozyme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is used in a method which involves the production of catalytic DNA molecules which can be used for cleaving targer nucleic acid molecules. Such DNA molecules can be used for cleaving targer nucleic medical such DNA molecules can be used in pharmaceutical and medical products (e.g. for wound debridement, clot dissolution), as well as in household items (e.g. derergents, dental hygiene products, meat tenderisers'). Other suitable substrates include those comprising or produced by picornaviruses, (e.g. HBV), gammaherpesvirinae (e.g. HBV), papticiomaviruses (e.g. HTV-1 and -1); [laviviruses, togaviruses, leukemia viruses (e.g. HTV-1 and -1); [laviviruses, contributing to immunodeficiency diseases and synchomes and retroviruses contributing to immunodeficiency diseases and synchomes and extra and eline immunodeficiency viruses and betalents viruses and feline immunodeficiency viruses and betalents viruses and solve in and feline immunodeficiency viruses and feline immunodeficiency viruses and feline immunodeficiency of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Bnzyme, catalygis, cleavage, target, pharmaceutical, medical, substrate, regulator, detergent, dental hygiene, meat tenderiser; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New catalytic DNA molecules - having site-specific endonuclease activity in a substrate nucleic acid, used for cleaving target nucleic acid
                                                                                                                                                                                                                                                                           Gaps

the present invention describes a catalytic twin molecule than expension throation describes a graph proposition to the catalytic DRA molecule comprises at least one pyrimidine included the catalytic DRA molecule, capable of hydrolytic cleavage of a nucleic acid phosphosefer bond. The catalytic DNA molecule capable of hydrolytic cleavage of a nucleic acid phosphosefer bond. The catalytic DNA molecule of a negal extranded nucleic acid in the absence. This is useful for cleavage of a nucleic acid phosphosefer bond. This is useful for cleavage containing and genetic empirication. This is useful in methods of engine at a specific position. This is useful in methods of engine is composed of only 12 residues, making this one of the amallest nucleic acid catalysts known. The catalytic core of the anallest nucleic acid catalysts known. The catalytic core of the anallest nucleic acid catalysts known. The catalytic core of the smallest nucleic acid catalysts known. The catalytic core of the smallest nucleic acid catalysts the 3 imidazole-containing residues. The enzyme can be made to cleave RNA of almost any sequence by simple alteration of the concentrations of 2024, exhibiting seturation kinetics and a catalytic core concentrations of 2024, exhibiting seturation kinetics and a catalytic core substrate-recognition properties of nucleic acid enzymes and the chemical functionality of protein enzymes in a molecule that is small in size, yet of present invention engalesing in the exemplification of the core. The present invention of the core of the catalytically efficient. The present sequence represents an olicy the catalytic core of the core of the catalytically efficient. The present sequence represents and a catalytically efficient. The present sequence represents and catalytically efficient.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New conjoined polynucleotides comprising a kinase domain and an adenylase domain, useful in DNA cloning, for carrying out sequential polynucleotide manipulations in a serial fashion, or for polynucleotide manipulations.
                                                                                                                                                                                                                                              Self-capping decxyribosyme; conjoined polynuclectide; catalyst; ribozyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention describes a conjoined polynucleotide comprising at least two catalytic domains which function in concert to provide a chemical transformation involving multiple sequential reactions. The use of the conjoined polynucleotides as catalysts offer advantages over protein-based enzymes in cloning and in a number of commercial and industrial processes. Onlyined polynucleotides made from DNA are expected to be much more stable, and can be easily made by automated oligonucleotide synthesis, and DNA is significantly more resistant to hydrolytic degradation compared to RNA. Conjoined DNA and RNA may be selected for their activity when immobilised. This sequence represents a template strand used in the selection protocol for self-capping deoxyribozymes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ċ

PCR primers ANV36574-75 were used in the course of the invention. The specification describes an allosteric DNA polynucleotide which can modify a function or configuration of the polynucleotide with a chemical effector and/or a physical signal. The allosteric polynucleotides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleosides, nucleotides, steroids, microbial or cellular metabolites, blood or urine components, pharmaceuticals, pesticides, herbicides, or food toxins. The allosteric polynucleotides can also be used for detecting physical signals such as radiation and temperature changes. The polynucleotides can also be used in biosensors, in which they are more stable than proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Allosteric polynucleotides - having modified function or configuration, used for the production of biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Primer 2 used to prepare the DNA pool and amplify deoxyribozymes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Allosteric DNA polynucleotide; modify, function, configuration, detection, biosensor, PCR primer; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention describes a conjoined polynucleotide comprising at least two catalytic domains which function in concert to provide a chemical cransformation involving multiple sequential reactions. The use of the conjoined polynucleotides as catalysts offer advantages over protein-based enzymes in cloning and in a number of comercial and industrial purchases. Conjoined polynucleotides made from DNA are expected to be much more stable, and can be easily made by automated oligonucleotide synthesis, and DNA is significantly more resistent to hydrolytic their ability to function on solid support and are expected to retain their activity when immobilised. This sequence represents a template decoxyribozymes, described in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                  Template DNA for self-phosphorylating deoxyriboryme selection.

PCR primers AAV36528-29 were used in the course of the invantion. The specification describes an allosteric DAA polymucleotide which can modify a function or configuration of the polymucleotide with a chemical effector and/or a physical signal. The allosteric polymucleotides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleosides, nucleotides, seroids, microbial or cellular metabolites, blood or unine components, pharmaceuticals, pesticides, harbicides, or food toxins. The allosteric polymucleotides can also be used for detecting physical signals such as radiation and temperature changes. The polymucleotides can also be used in biosensors, in which they are more stable chan proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic acid with endonuclease activity - used to cleave targetted for modulating gene expression in plant or animal cells, particularly treatment or diagnosis of disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          activity. The nucleic acids of the invention can cleave a target nucleic acid, particularly RNA, for modulation of gene expression in plant or animal cells, e.g. for disgnosis and/or treatment of diseases, such as inhibitation of cell proliferation, and also for examining genetic drift and mutations in cells rolls to detect the target (mutant or wild-type) in cells and possibly for RNA sequencing. The nucleic acids, optionally completed with cationic lipid, are delivered to smooth muscle calls (via catheter or stent, incorporated in hipplymer and by injection), or vectors that express them are introduced into cells ex vivo or in vivo. The nucleic scids catals endered acids catalyse both intra- and inter-molecular endonuclease reactions in a sequence-specific manner, and are not homologous with known ribosymes. They can be designed to target almost any RNA transcript
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hammerhead ribozyme; nucleic acid catalyst; synthesis; target; ATP-dependent allosteric ribozyme; endoudlease activity; cleave; modulating gene expression; treatment; diagnosis; genetic drift; mutation; cell proliferation; PCR primer; se.

                                                                                                                                                                                                                                                                                                               PCR primers AAV36576-78 were used to amplify the DNA pool, and selected sel-cleaving DNAs (decayribozymes). The specification describes an allosferic DNA polymorlectide which can modify a function or configuration of the polymorlectide with a chemical effector and/or a physical signal. The allosteric polymorlectides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleosides, nucleotides, steroids, microbial or callular metabolites, blood or urine components, pharmaceuticials, pesticides, harbicides, or food coarins. The allosteric polymorlectides can also be used for detecting physical signals such as radiation and temperature changes. The polymorlectides can also be used in blosensors, in which

Such catalytic DNA molecules (see also AAT34901-T34967) specifically cleave as nucleic acids, esp. RNA sequences (this sequence is cleaved at the of the ribonucleotide base) site. The catalytic DNAs may be used in medicine e.g. for wound debridement, clor dissolution, etc., or in detergents, dental hygiene products and mear tenderisers. The DNAs may be useful to treat viral infections such as HIV when targetted to viral nucleic acid and they may be expressed in a target host cell. In vitro selection of the DNAs allows the isolation of catalysts/enrymes without the need for prior knowledge of their compen. or structure
and since they are relatively small are reasonably inexpensive to produce. The present sequence represents a PCR extension reaction primer used in an example from the present invention for in vitro selection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New DNA with site specific endonuclease activity - partic. for cleavage of RNA, e.g. for medical use.
                                                                                                                                                                                                                                                                                                 Gaps

```
This sequence is used in a method which involves the production of catalytic DNA molecules which can be used for cleaving target nucleic acid molecules. Such DNA molecules can be used in pharmaceutical and medical products (e.g. for wound destriement, clot dissolution), as well as in household items (e.g. detergents, dental hygiene products, meat renderisers). Other sultable substrates include those comprising or produced by picornaviruses, hepsdawiridae, (e.g. HBV, HCV), pspttiomaviruses (e.g. HPV), gammaharpesvirinae (e.g. HBV, HCV), pspttiomaviruses (e.g. HTV-1 and -11;, larghtviruses, togaviruses, between a viruses (e.g. HTLV-1 and -11;, all aviviruses), cytomegaolytiuses (including alphaberpesviruse and betaherpesviruses contributing to immunodeficiency diseases and syndromes and retroviruses contributing to immunodeficiency viruses and bovine jeukemia viruses. They can also be used as regulators of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New catalytic DNA molecules - having site-specific endonuclease activity in a substrate nucleic acid, used for cleaving target nucleic acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence is used in a method which involves the production of catalytic DNA molecules which can be used for cleaving target nucleic acid molecules. Such DNA molecules can be used in pharmaceutical and medical products (e.g. for wound debridement, clot dissolution), as well as in household items (e.g. detergents, dental hygiene products, meat tenderisers). Other subtable substrates include those comprising or produced by picornaviruses, hepadnaviridee, (e.g. HBV, HCV), papitiomaviruses (e.g. HBV), gammaherpesvirinae (e.g. HBV), HCV), in Jymphocryptoryinuses, leukemia viruses (e.g. HILV-1 and -11), flaviviruses, cogaviruses, leukemia alphaberpesviruse and betaberpesviruses (c.g. HIV-1 and -2), simian and feline immunodeficiency viruses and bovine leukemia viruses and solver immunodeficiency viruses and bovine leukemia viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Catalytic, enzymatic, modified nucleotide, enzyme, site-specific, target,

The present invention describes a catalytic at a defined cleavage site, where the catalytic DNA molecule comprises at least one pyrimidine uncleared in (1) (1) is a catalytic DNA molecule, capable of hydrolytic cleavage of a mucleic acid phosphoester bond. The catalytic DNA molecule can assert the a mucleic acid in the molecule, capable of hydrolytic cleavage of a mucleic acid in the absence of a restriction of single-arranded mucleic acid in the absence of a restriction and muclease site a specific position. This is useful for cleavage of a single-arranded mucleic acid in the absence of a restriction of the mucleic acid only 12 residues, making this one of the simplination crayme is composed of only 12 residues, making this one of the malliest nucleic acid catalysic core forms a compact hairpin the margine the indiatole-containing residues. The enzyme can be made to cleave RNA of almost any sequence by simple alteration of the two substrate-recognition domains that surround the catalytic core. The carryme operates with multiple turnover in the presence of micromolar concentrations of Zn3+, exhibiting sequencion kinetics and a catalytic care uncatalysed reaction. The imidazole-containing DNA enzyme and the chemical substrate-recognition properties of nucleic acid enzymes and the chemical correction. The imidazole-containing DNA enzyme and the chemical correction into properties of nucleic acid enzymes and the chemical correction. The indiatole-containing DNA enzyme and the chemical correction into properties of nucleic acid enzymes and the chemical correction. The indiatole-containing DNA enzyme and the chemical correction into properties of nucleic acid enzymes and the chemical correction. The present sequence represents an engagement of properties of correction of the correction of the present sequence represents an engagement of approximately and engagement of a used in the exemplification of the correction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Catalytic; enzymatic; modified nucleotide; enzyme; site-specific; target; substrate; template; primer; cleavage; hydrolytic cleavage; nucleic acid phosphoester bond; cloning; genetic engineering; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Ensymatic DNA molecules containing modified nuclectides useful for cleavage of RNA at a specified position.
substrate, template, primer, cleavage, hydrolytic cleavage, nucleic acid phosphoester bond, cloning, genetic enginecting, as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes a catalytic DNA molecule that

The present invention describes a catalytic DNA molecule that

specifically cleaves a substrate nucleic acid at a defined cleavege site,
where the catalytic DNA molecule comprises at least one pyrimidine
nucleotide (I). (I) is a catalytic DNA molecule, capable of hydrolytic
cleavage of a nucleic acid phosphoseter bond. The catalytic DNA molecule
is used to cleave NNA of almost any sequence. This is useful for cleavage
of single-stranded nucleic acid in the absence of a restriction
conductance site at a specific posttion. This is useful in methods of
c.g. cloning and genetic engineering. The catalytic core of the minimised
anyme is composed of only 12 residues, making this one of the single-
catalytic core for manipulation of the concurred and state anyme can
be ructure displaying the 3 imidatole-containing residues. The enayme can
be made to cleave RNA of almost any sequence by simple alteration of the
curyme operates with multiple turnover in the presence of micromolar
concentrations of zn2+, exhibiting saturation kinetics and a catalytic
concentrations of zn2+, exhibiting saturation kinetics and a catalytic
concentrations of zn2+, exhibiting saturation functions and a catalytic
curvatalysed reaction. The imidatole-containing DNA enzyme combines the
substrate-recognition properties of nucleic acid enzymes and the chemical
curvatalysed reaction. The imidatole-containing DNA enzyme combines
concentrationality of protein enzymes in a molecule that is small in size, yet
concentrations the sequence which is used in the exemplification of the

The present invention relates to biosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quencher ox/and a fluorophore and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of ar ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a PCR primer used to isolate a ribozyme which may be used as a biosensor of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Biosensor; ion detection; lead; zinc; cobalt; nucleic acid enzyme; quencher; fluorophore; photodetector; ion concentration; ribozyme; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ô
                                                                                                                                                                                   The present invention relates to biosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quancher or/and a fluorophore and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a ribozyme which may be used as a biosensor of the invention
                                                       and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gape
                        New nucleic acid enzyme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Self-cleaving DNA; allosteric DNA polynucleotide; modify; function; configuration; detection; biosensor; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            13.18

                                    The present sequence represents a self-cleaving DNA molecule of the invention. The specification describes an allosteric DNA polymucleotide which can modify a function or configuration of the polymucleotide with a comprise the present sequence. The allosteric polymucleotide can comprise the present sequence. The allosteric polymucleotides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleosides, nucleotides, steroids, microbial or cellular metabolites, blood or urine components, pharmaceuticals, pesticides, harbicides, or food toxins. The allosteric polymucleotides can also be used for detecting physical signals such as radiation and temperature changes. The polymucleotides can also be used in biosensors, in which they are more stable than proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Self-cleaving DNA, allosteric DNA polymucleotide, modify, function, configuration, detection; biosensor; ss.

The present invention relates to biosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a ribozyme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New nucleic acid enzyme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Biogensor; ion detection; lead; zinc; cobalt; nucleic acid enzyme; quencher; fluorophore; photodetector; ion concentration; zibosyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents a self-cleaving DNA molecule of the invention. The specification describes an allosteric DNA polymucleotide which can modify a function or configuration of the polymucleotide with a chemical effector and/or a physical signal. This polymucleotide can comprise the present sequence. The allosteric polymucleotides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleosides, nucleotides, steroids, microbial or callular metabolites, blood or urine components, pharmaceuticals, pesticides, broad or urine components, pharmaceuticals, pesticides to an also be used for detecting physical signals such as radiation and temperature changes. The polymucleotides can also be used in biosensors, in which they are more stable than proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Allosteric polynucleotides - having modified function or configuration, used for the production of biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Biosensor; ion detection; lead; zinc; cobalt; nucleic acid enzyme; quencher; fluorophore; photodetector; ion concentration; zibozyme; ss.

This sequence is used in a method which involves the production of catalytic DNA molecules which can be used for cleaving target nucleic actalytic DNA molecules which can be used for cleaving target nucleic medical products (e.g. for wound debridement, clot dissolution), as well as in household teems (e.g. detergents, dental hygiene products, meat tenderisers'). Other suitable substrates include those comprising or produced by picornaviruses, hepadnaviridae, (e.g. HBV, HCV), pammaharpevirinae (e.g. HBV, HCV), pammaharpevirinae (e.g. EBV; lymphocryptoviruses), leukenia viruses (e.g. HELV-1 and -11); tlavitviruses, togaviruses, herpesviruses (ficcluding alphaherpesviruse and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New catalytic DNA molecules - having site-specific endonuclease activity
in a substrate nucleic acid, used for cleaving target nucleic acid
sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ensyme, catalysis, cleavage, target, pharmaceutical; medical; substrate; regulator, detergent, dental hygiene, meat tenderiser; ss.
      AMINABIL-T14967 are single stranded (ss), non-naturally occurring DNA molecules that have site-specific endonuclesse activity. The carelytic DNA molecules specifically cleave so nucleic acids, esp. RNA sequences. The carelytic DNAs may be used in medicine e.g. for wound debridement, cloc dissolution, etc., or in detergence, dental hygiene products and meat tenderisers. The DNAs may be useful to treat viral infections such as HIV when targetted to viral nucleic acid and they may be expressed in a target host cell. In vira selection of the DNAs allows the isolation of catalysts/ensymas without the need for prior knowledge of their compen. or structure

                                                                                                                                                                                                                                                                                                                                                                        Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô
                                                                                                                                                                                                                                                          The present invention relates to biosensors, comprising a nucleic acid enryme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a sequence described in the exemplification of the invention
                                                                                                                                     New nucleic acid enzyme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New DNA with site specific endonuclesse activity - partic. for cleavage of RNA, e.g. for medical use.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

                                                                                                                                                                                                                                                    The present invention describes a catalytic DNA molecula that specifically cleaves a substrate mucleic acid at a defined cleavage site, where the catalytic DNA molecule comprises at least one pyrimidine nucleotide [1]. [1] is a catalytic DNA molecule, capable of hydrolytic cleavage of a nucleic acid phosphoester bond. The catalytic DNA molecule of elastic cleavage of a nucleic acid in the absence of a restriction of single-stranded nucleic acid in the absence of a restriction of elasgies atte at a specific position. This is useful for cleavage of of cleavage of an ordinary and genetic enginearing. The catalytic core of the minimised enzyme is composed of only 12 residues, making this one of the smallest nucleic acid catalytes known. The catalytic core of the minimised enzyme is composed of only 12 residues, making this one of the smallest nucleic acid catalytes core force of the minimised enzyme is composed of almost any sequence by simple alteration of the two substrate-recognition domains that surround the catalytic core. The consyme operates with multiple turnover in the presence of micromolar concentrations of $274+, exhibiting saturation kinetics and a catalytic create enhancement of approximately 1000000-fold compared to the substrate-recognition properties of nucleic acid earlytic such the substrate-recognition properties of nucleic acid earlytic such the functionality of protein ensymes in a molecule that is small in size, yet versatile and cetalytically efficient. The present sequence represents an

The invention describes a conjoined polynucleotide comprising at least two catalytic domains which function in concert to provide a chemical transformation involving multiple sequential reactions. The use of the conjoined polynucleotides actaalysts offer advantages over proteinbased enzymes in cloning and in a number of commercial and industrial processes. Conjoined polynucleotides made from DNA are expected to be much more stable, and can be easily made automated oligonucleotide symbosis, and DNA is significantly more resistant to hydrolytic degradation compared to RNA. Conjoined DNA and RNA may be selected for their activity when immobilised. This sequence represents an acceptor construct used in the selection of self-capping deoxyribozymes, described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New conjoined polynucleotides comprising a kinase domain and an aderylase domain, useful in DNA cloning, for carrying out sequential polynucleotide canipulations in a serial fashion, or for polynucleotide manipulations.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to blosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a ribozyme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New nucleic acid enzyme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Self-phosphorylating deoxyribozyme; conjoined polynucleotide; catalyst;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaba
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

AAL45458;

```
New conjoined polynucleotides comprising a kinase domain and an adenylase domain, useful in DNA cloning, for carrying out sequential polynucleotide manipulations in a serial fashion, or for polynucleotide manipulations.
                                                                                                                                                                                                                                                                                                                                                  //tag= a
/bound_moiety= 'ABK10807'
/boure= 'Porms a double stranded region with the template
strand shown in ABK10807'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention describes a conjoined polynucleotide comprising at least two catalytic domains which function in concert to provide a chemical transformation involving multiple sequential reactions. The use of the conjoined polynucleotides as catalysts offer advanceses over protein-based enzymes in cloning and in a number of commercial and industrial processes. Conjoined polynucleotides made from INA are expected to be such more stable, and can be easily made by automated oligonucleotide synthesis, and DNA is significantly more resistant to hydrolyric their ability to function on solid support and are expected to retain their ability to function on solid support and are expected to retain their activity when immobilised. This sequence represents an acceptor construct used in the selection of self-phosphorylating deoxyribozymes,
                                                                                                                   Self-phosphorylating deoxyribozyme; conjoinad polynuclaotida; catalyst; ribozyme; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /*tag= c

The present invention relates to biosensors, comprising a nucleic acid enzyme dependent on an ion to produce a product, a quencher or/and a fluorophore and a photocodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal ions such as lead. The biosensors may also be used to detectine the concentration of a particular ion in a solution. The present sequence is a substrate of a ribozyme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Mew nucleic acid enzyme biosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                       /*tag= b

The present invention relates to biosensors, comprising a nucleic acid ensyme dependent on an ion to produce a product, a quencher or/and a Eluorophors and a photodetector. The biosensors are useful for the sensitive and selective detection of ions. The biosensors are useful in methods of detecting the presence of an ion, particularly metal lons such as laad. The biosensors may also be used to determine the concentration of a particular ion in a solution. The present sequence is a riboryme which may be used as a biosensor of the invention
                                                                                                                                                                                                                                                                                                                        New nucleic acid enzyme blosensors, useful for the sensitive and selective detection of ions, particularly metal ions e.g. lead ions, and for determining the concentration of a particular ion in a solution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ensyme, catalysis, cleavage, target, pharmaceutical, medical; substrate; regulator, detergent, dental hygiene, meat tenderiser, ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a self-cleaving DNA molecule HD2 (ribozyme) of the invention. The specification describes an allosteric DNA polymocleotide which can modify a function or configuration of the polymucleotide with a chemical effector and/or a physical signal. This polymucleotide can comprise the present sequence. The allosteric polymucleotides can be used for detecting the presence or concentrations of compounds such as amino acids, peptides, nucleotides, nucleotides, preroids, microbial or cellular metabolites, blood or urine components, pharmaccuticals, pesticides, herbicides, or food toxins. The allosteric polymucleotides can also be used for detecting physical signals such as radiation and temperature changes. The polymucleotides can also be used in biosensors, in which they are more stable than proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Allosteric polynucleotides - having modified function or configuration, used for the production of biosensors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Biosensor; ion detection; lead; zinc; cobalt; nucleic acid enzyme; quencher; fluorophore; photodetector; ion concentration; ribozyme; ss.

specifically cleaves a substrate a uncleic acid at a defined cleavage site, where the catalytic DNA molecule comprises at least one pyramidine uncleotide [1]. [1] is a catalytic DNA molecule, capable of hydrolytic cleavage of a nucleic acid phosphoester bond. The catalytic DNA molecule cleavage of a nucleic acid phosphoester bond. The catalytic DNA molecule is used to cleave RNA of almost any sequence. This is useful for cleavage of single-etranded mucleic acid in the absence of a restriction cleavage of single-etranded mucleic acid in the absence of a restriction argume is composed of only 12 residues, making this one of the ministed argume is composed of only 12 residues, making this one of the smallest nucleic acid catalyses known. The catalytic core of the ministed argume is composed of only 12 residues, making this one of the smallest nucleic acid catalyses known. The catalytic core forms a compact hairpin structure displaying the 3 indiacel-containing residues. The enzyme can be made to cleave RNA of almost any sequence by simple alteration of the two substrate-recognition domains that surround the catalytic core. The caryme operates with multiple turnover the presence of micromolar concentrations of 22.4, exhibiting saturation kinetics and actalytic core uncatalysed reaction. The imidazole-containing DNA enzyme combines the substrate-recognition properties of nucleic acid enzymes and the chemical functionality of proceeds anymes in a molecule that is small in size, yet core transmitting as male acquence represents an expension of the contained sequence which is used in the exemplification of the contained sequence which is used in the exemplification of the contained sequence represents and catalytically efficient. The present sequence of the contained and catalytically efficient. The present sequence of the contained and ca

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ક્રે
                                                                                                                                                                                                                                This sequence is used in a method which involves the production of catalytic DNR molecules can be used for cleaving target nucleic acid molecules Such DNR molecules can be used in pharmaceutical and medical products (e.g. for wound debridement, clot dissolution), as well as in household items (e.g. detergents, dental hygiene products, meat renderisers'). Other suitable substrates include those comprising or produced by picornaviruses, hepadraviridae, (e.g. HBV, HCV), papitiomaviruses (e.g. HBV), gammaharpesvirinae! (e.g. HBV, HCV) illymphocryptoviruses (e.g. HPV), gammaharpesvirinae! (e.g. HBV), flaviviruses, togaviruses, increase (e.g. HTV-1 and -11), flaviviruses, cycomegaclviruses (GNV), influenza viruses and betaherpesviruses contributing to immunodeficiency viruses and el. Hiv-1 and -2), simian and felina immunodeficiency viruses and bovine leukemia viruses. They can also be used as regulators of gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ō
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Catalytic; enzymatic; modified nucleotide; enzyme; site-specific; target; substrate; template; primer; cleavage; hydrolytic cleavage; nucleic acid phosphoester bond; cloning; genetic engineering; ss.
                                                                     satalytic DNA molecules - having site-specific endomuclease activity substrate nucleic acid, used for cleaving target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ensymatic DNA molecules containing modified nucleotides useful for cleavage of RNA at a specified position.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         õ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                쉱
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes a catalytic INA molecule that specifically cleaves a substrate nucleic acid at a defined cleavage site, where the catalytic DNA molecule comprises a part least one pyrimidine catalytic DNA molecule, capable of hydrolytic cleavage of a nucleic acid phosphoester bond. The catalytic DNA molecule is used to cleave RNA of almost any sequence. This is useful for cleavage of a nucleic acid phosphoester bond. The catalytic DNA molecule is used to cleave RNA of almost any sequence. This is useful in methods of andomiclase site at a specific position. This is useful in methods of andomiclase site at a specific position. This is useful in methods of e.g. cloning and genetic engineering. The catalytic core of the smallest nucleic acid catalytes known. The catalytic core of the smallest nucleic acid catalytic state accompact halippin the made to cleave RNA of almost any sequence by simple alteration of the two substrate-recognition domains that surround the actalytic core. The engage of catalytic core in the presence of micromolar concentrations of Zn2+, exhibiting saturation kinetics and a catalytic rate enhancement of approximately inconou-fold compared to the substrate-recognition properties of nucleic acid enzymes and the chemical functionality of protein enzymes in the sequence represents an enjample and catalytically efficient. The present sequence represents an olicinal content and catalytically efficient. The present exemplification of the content and catalytically efficient. The present exemplification of the content of the sequence which is used in the exemplification of the content and catalytically efficient in the exemplification of the content and catalytically efficient in the exemplification of the content of the content and catalytically efficient in the exemplification of the content of the content and catalytically efficient is a small in size, we content the content and catalytically efficient in the exemplification of the content of the content and catalytically efficient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Catalytic; enzymatic; modified nuclectide; enzyme; site-specific; target; substrate; template; primer; cleavage; hydrolytic cleavage; nucleic acid phosphoester bond; cloning; genetic engineering; ss.

The present invention describes a catalytic DNA molecule that

specifically clasves a substrate nucleic acid at a defined cleavage site,
where the catalytic DNA molecule comprises at least one pyrimidine
nucleotide (I). (I) is a catalytic DNA molecule, capable of hydrolytic
cleavage of a mucleic acid phosphoseter bond. The catalytic DNA molecule
of single-erranded nucleic acid in the absence of a restriction
of single-erranded nucleic acid in the absence of a restriction
of communicate site at a specific position. This is useful in methods of
e.g. cloning and generic engineering. The catalytic core of the minimised
aryme is composed of only 12 residues, making this one of the smallest
nucleic acid catalysts known. The catalytic core of the minimised
enzyme is composed of only 12 residues, making this one of the smallest
nucleic acid catalysts known. The catalytic core forms a compact hairpin
structure displaying the 1 indazole-containing residues. The enzyme can
be made to cleave RNA of almost any sequence by simple alteration. Of the
two substrate-recognition domains that surround the catalytic core. The
concentrations of Zn2+, exhibiting seturation kinetics and a catalytic
crate enhancement of approximately 10000000-fold compared to the
substrate-recognition properties of nucleic acid enzymes and the chemical
concentration and catalytically efficient. The present sequence represents an
concential invention
disponucleotide sequence which is used in the exemplification of the
present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gape
Ensymatic DNA molecules containing modified nucleotides useful for cleavage of RNA at a specified position.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      90.0%; Score 18; DB 3; Length 19; 100.0%; Pred. The present invention relates to probes complementary to a single strand of an RNA polymerase promoter sequence, and a blocking group adjacent or substantially adjacent to the promoter sequence. The probes are useful for detecting nucleic acid sequence of interest in a sample, for e.g. a nucleic acid which is a marker of genetic or infectious disease. The present sequence is one such probe which was used in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel probe molecule useful for detecting nucleic acid sequence in a sample, comprises single stranded nucleic acid sequence complementary to target sequence, RNA polymerase promoter sequence, and blocking group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                      RNA polymerase promoter; probe; disease marker detection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RNA polymerase promoter; probe; disease marker detection; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     õ
                                                                                                                                              The present invention relates to a complex formed by the hybridisation of a target nucleic acid (e.g. a bacteriophage RNA polymerase promoter sequence) and probes. The probes are useful in an assay for detecting the presence of a nucleic acid sequence of interest, in a sample. The present sequence is a probe which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to probes complementary to a single strand of an RNA polymerase promoter sequence, and a blocking group adjacent or substantially adjacent to the promoter sequence. The probes are useful for detecting nucleic acid sequence of interest in a sample, for e.g. a nucleic acid which is a marker of genetic or infectious disease. The present sequence is one such probe which was used in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ů
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel probe molecule useful for detecting nucleic acid sequence in a sample, comprises single stranded nucleic acid sequence complementary target sequence, RNA polymerase promoter sequence, and blocking group.

Novel probe molecule useful for detecting nuclaic acid sequence in a sample, comprises single stranded nucleic acid sequence complementary to target sequence, RNA polymerase promoter sequence, and blocking group.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to probes complementary to a single strand of an RNA polymerase promoter sequence, and a blocking group adjacent or substantially adjacent to the promoter sequence. The probes are useful for detecting nucleic acid sequence of interest in a sample, for e.g. a nucleic acid which is a marker of genetic or infectious disease. The present sequence is one such probe which was used in the present
present sequence is one such probe which was used in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RNA polymerase promoter; probe, disease marker detection, ss.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Description
